

Dynamics of volumetrically heated matter passing through the liquid-vapor metastable states

 $\Delta p_{1\rightarrow 2} > 0$

(follows from $\Delta T_{1\rightarrow 2} > 0$)

5 / 15

For $p_1=p_0=0.5$ kbar: $T_2\approx T_1+40$ K, $p_2\approx 1.6$ kbar $\approx 3p_1$

 $\Delta T_{1\rightarrow 2} > 0$

(can be rigorously proven)
